Android studio logcat search bar not showing

Getting logs using AndroidStudio or LogCat This is a tutorial on how to get the log files on Android.1. Go to and download the version of Android Studio for your operating system.If the correct option is not displayed under the Download button, click Download Options to see all the downloads available.2. Install Android Studio, accepting the defaults.3. Launch Android Studio and accept the defaults in the Android Studio Setup Wizard.4. Set up USB debugging on the device. (Device Settings > System > About phone > Tap 5 times on the Build number > Developer options becomes enabled > Go back > Open Developer options > Turn ON USB debugging)5. In Android Studio, click "Start a new Android Studio project" > double-click the No Activity project to create an empty project > leave the defaults and click Finish.6. Update your tools with the SDK manager.To open the SDK Manager from Android Studio, click Tools > SDK Manager.When an update is available for a package you already have, a dash appears in the check box next to the package.To update an item or install a new one, click the checkbox so it shows a checkmark.To uninstall a package, click to clear the checkbox.7. Plug the device into the computer and allow USB debugging if prompted. If USB debugging is not allowed, the device will not show up in Android Studio.8. The device should show up in the drop-down in the top middle of the screen.If the device does not show up, try unplugging the USB cord and plugging it back in. If that does not work, try selecting Troubleshoot Device Connections from the same drop-down.9. Click Logcat at the bottom of the screen to open the Logcat window.10. Drag the top of the Logcat window up to see more of the log at once and to be able to see the icons on the side of the window easily.11. Use the trashcan button to clear the log before performing the steps to be logged.12. Click the drop-down to the left of the search field to change the logging level if needed.13. To save the log click in the log window > press CTRL +A > CTRL +C (Command + A > Command +C for Mac) > paste the log into a text editor and save as a .txt file.Other features:Android studio can also be used to get screen shots using the camera button and screen recordings using the screen record button.Screen recordings can be a maximum of 3 minutes.Read about viewing logs with LogCat.

If you didn't manage to capture logs with the above tutorial, visit this page and follow the instructions to capture Android logs. Photo by Pakata Goh on UnsplashIt doesn't matter how powerful the weapon is unless you know how to use it. Android Studio is one of the most powerful IDEs in the wild. It has tons of shortcuts, loads of powerful features like live templates, a built-in emulator, database inspector, and more.Yet, most of the developers don't even know the existence of these features. As a developer, we should know the strengths of the IDE and use them to increase productivity, not the other way around.No matter how many power features we have, debugging is the key area where developers need as much support as possible from the IDE. Android Studio is a great tool not only for smart coding but also to debug the code in depth.In this article, I'm going to focus on how to customize the logcat in Android Studio. We'll be discussing how to apply filters, custom colors, remove unnecessary information, and more.In general, every IDE maker tries to display as much data as possible in the logcat to meet every developer's end needs. In the maker's perspective, you might be an application developer or a system-wide engineer. They will design the default behavior to benefit the most variety of developers.But when it comes to individual preferences, this might not be effective. For example, if you're an app developer, you don't need to monitor data like date, time, processor, thread IDs, and package name.To better understand the benefits of formatting the log, let's display a simple log without custom format. As an application developer, I intend to see the log.When we print a log by default, it'll display as shown above. In general, most of the application developers don't bother about date and time, process and thread IDs, and package name.We can remove them by clicking on the settings icon on the left panel and deselecting the fields that we don't need. Have a look:There are five types of logs in Android studio, such as Log.v(), Log.d(), Log.i(), Log.w(), and Log.e() and there levels of verbosity (VERBOSE, DEBUG, INFO, WARNING, ERROR). You can also filter which logs to appear in the logcat, as shown below.Now that we know the basic types of logs, let's see how to assign custom colors to each type. Assigning a red color to error log and green to information log helps us to have a clear and distinct vision of the logs while debugging.To customize the colors in the logcat navigate, follow the steps below:File > Settings > Editor > Colors Scheme > Android Logcat.We then need to pick the type of log to which we need to update the color. After that, mark the foreground checkbox; it'll enable the color selection area to the log type.Once you click on that color, it'll display a color palette from which we can choose. We can also give the color code in RGB or hex-code format in the panel. Have a look:If you're working on Android Studio, it's inevitable to use logcat either to debug or to see the stack trace of a crash. Android Studio logcat displays a vast amount of data regarding the device activity.In reality, we only need minor information such as stack trace, exceptions, or error logs. By default, the logcat shows the activity of the entire device; we can change this by using show only selected application option, as shown below:This will clean up 90% of the data in the logcat by only displaying the log related to the current application.By default in Android Studio, the logcat window is attached to the bottom panel. Personally, I don't feel comfortable with that, so I did some digging to find out if there is a way to change the default behavior.I found out that we can change the logcat window default behavior using the view mode option under setting icons in the top-right corner of the logcat window. Have a look:Out of the box, there are five view modes that we can choose. Let's a take look at how each mode works:Dock pinned: This is the default behavior when the logcat is attached to the bottom panel and is always visible along with the editor and other pinned windows.Dock unpinned: In this mode, The logcat is attached to the bottom panel but is visible only while it's active. It does not obstruct the editor or other windows.Undock: The logcat is attached to the bottom panel and covers a part of the editor or other windows when active. It is not visible when another window is active.Float: In this case, the logcat is detached from the bottom panel, floating on top of the main window. It's visible only together with the main project window.Window: Here, the logcat seems to be a separate application window. You can view it independently from the main project window and even move it to a different monitor.That's all for now — hope you learned something useful, and thanks for reading.
